Art Unit: 2611

DETAILED ACTION

1. Claims 1-17, and 20-27 are pending in the instant application.

Response to Amendment/Argument

The Applicant's remarks, filed December 8, 2008, have been fully considered.
 In view of the Applicant's amendments to the claims, an updated rejection is set forth below.

The claims have been amended to recite that "the confidence values comprise constant values based on the mapping." The Applicant's remarks make clear that the Applicant regards the claimed "constant confidence values" to be beyond the prior art of record's disclosure. The Examiner has attempted to determine what limitations should be attributed to a confidence value being a "constant" one. In a reasonably broad sense, a confidence value (i.e. a soft confidence value attribute) in the prior art may be considered "constant" if is it not changed once it is assigned. In the instant application, the basis for the amendment can be found on page 12 wherein bits of the highest confidence are assigned a "constant" value of α as a soft value. It is noted by the Examiner, however, that this "constant" value is only as constant as the implementation of the invention requires. That is, it may vary, depending upon the embodiment (as implemented according to design choice), among values (see page 12, lines 20-25). Therefore, as broadly as claimed, assigning a "constant" confidence value in the instant application simply resolves to an assignment of a particular confidence value for a bit.

Claim Rejections - 35 USC § 102

Application/Control Number: 10/539,355

Art Unit: 2611

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. § 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Page 3

4. Claim 1-4, 6, 7, 9, 10-13, 15, 16, and 20-22, 26, and 27 are rejected under 35 U.S.C. § 102(e) as being anticipated by Reshef (U.S. Pat. No. 6529559).

Regarding claim 1, Reshef discloses a method of processing a data signal comprising symbols (fig. 4, constellation points) each representing a plurality of data bits (fig. 4, "000", "001", etc.), the method comprising: demodulating the data signal to determine the symbols (fig. 2, refs. 52 and 56); mapping each of the symbols to a plurality of bits (fig. 3, ref. 86); assigning a confidence value (i.e. a log likelihood ratio LLR) to each bit in a symbol (fig. 3, ref. 86; col. 11, lines 4-12), and effecting convolutional decoding (fig. 2, ref. 64) of a bit stream associated with the assigned confidence values, wherein the confidence values comprise constant values based on the mapping. Reshef discloses a data signal processor which demodulates (fig. 2, ref. 52) a received signal, equalizes it with a hard decision output (col. 9, lines 15-20 and 55-60), converts the hard decisions from the equalizer into corresponding confidence values or "reliabilities" (fig. 3, ref. 84; col. 10, lines 59-65), and passes the confidence values to a convolutional decoder (fig. 2, ref. 52; col. 3, lines 5-10). As broadly as claimed, Reshef's confidence values comprise "constant" values because they are not

Page 4

Art Unit: 2611

altered once they are assigned. Reshef assigns constant confidence values (fig. 3, ref. 86) to soft bits according to a LLR assignment method (col. 12, lines 1-65; eq. 5) and they are not modified until hard decisions are resolved (fig. 2, ref. 64).

Regarding claim 2, Reshef discloses the limitations of claim 1 as applied above. Further, Reshef discloses that the step of assigning a confidence value comprises, in part, mapping symbols to binary bits by means of a Gray code (col. 15, lines 35-53).

Regarding claim 3, Reshef discloses the limitations of claim 1 as applied above. Further, Reshef discloses incorporating data from the step of assigning in a look-up table for reference (col. 16, lines 25-53).

Regarding claim 4, Reshef discloses the limitations of claim 1 according to Reshef's embodiment of figures 2 and 3 as applied above. Reshef does not explicitly disclose, according to his figures 2 and 3 embodiment, re-coding hard decisions as an (I,Q) pair and taking soft decisions therefrom. However, Reshef discloses, in a separate embodiment according to figure 9, re-coding hard decisions as an (I,Q) pair (fig. 9, refs. 156, 158, and 160) and taking soft decisions therefrom (fig. 9, ref. 162). Moreover, Reshef discloses that the method of the embodiment of figure 3 is incorporated in to the method of the embodiment of figure 9 (col. 19, lines 25-40; i.e. within block 162 of figure 9). Therefore, Reshef's embodiment of figure 9, which incorporates all the features of the figure 3 embodiment (i.e. the limitations of claim 1), discloses all the limitations of claim 4.

Regarding claim 6, Reshef discloses the limitations of claim 1 as applied above. Further, Reshef discloses an executable software (fig. 12) embodiment wherein a digital

processor (fig. 12, ref. 202) is "operative to execute software adapted to perform the reduced information packet method" of his invention (col. 20, lines 25-50). Therefore, in such embodiment, Reshef's equalization (fig. 2, ref. 56) is performed by a digital processor.

Regarding claim 7, Reshef discloses the limitations of claim 1 as applied above. Further, Reshef discloses an executable software (fig. 12) embodiment wherein a digital processor (fig. 12, ref. 202) is "operative to execute software adapted to perform the reduced information packet method" of his invention (col. 20, lines 25-50). Therefore, in such embodiment, Reshef's equalization (fig. 2, ref. 56) is performed by a dedicated signal processing hardware (fig. 12, ref. 202) for equalization.

Regarding claim 9, Reshef discloses a computer program product directly loadable into the internal memory of a digital computer, comprising software code portions for performing the steps of claim 1 (as applied above in claim 1) when said product is run a computer (col. 20, line 25 – col. 21, line 20).

Regarding claim 10, Reshef discloses the limitations of the claim as applied to claim 1 above.

Regarding claim 11, Reshef discloses the limitations of claim 10 as applied above. Further, Reshef discloses the remaining limitations of the claim as applied 2 above.

Regarding claim 12, Reshef discloses the limitations of claim 10 as applied above. Further, Reshef discloses the remaining limitations of the claim as applied 3 above.

Regarding claim 13, Reshef discloses the limitations of claim 10 as applied above. Further, Reshef discloses the remaining limitations of the claim as applied 4 above.

Regarding claim 15, Reshef discloses the limitations of claim 10 as applied above. Further, Reshef discloses the remaining limitations of the claim as applied 6 above.

Regarding claim 16, Reshef discloses the limitations of claim 10 as applied above. Further, Reshef discloses the remaining limitations of the claim as applied 7 above.

Regarding claim 20, Reshef discloses the limitations of claim 1 as applied above. Further, Reshef discloses that the step of assigning a confidence value to each bit in a symbol includes assigning a confidence value based upon the position of the bit in its symbol (see, generally, table 1, col. 16, lines 30-45). According to Reshef's confidence value correspondence table, the confidence value to be assigned is dependent upon bit position (i.e. MSB, SSB, or LSB) for the reference symbol.

Regarding claim 21, Reshef discloses the limitations of claim 10 as applied above. Further, Reshef discloses the remaining limitations of the claim as applied 20 above.

Regarding claim 22, Reshef discloses the limitations of claim 9 as applied above. Further, Reshef discloses that wherein assigning confidence values to bits comprises retrieving confidence values from a look-up table (col. 16; TABLE 1).

Art Unit: 2611

Regarding claim 26, Reshef discloses the limitations of the claim as applied to claim 1 above.

Regarding claim 27, Reshef discloses the limitations of claim 26 as applied above. Further, Reshef discloses that the step of assigning a confidence value comprises, in part, mapping symbols to binary bits by means of a Gray code (col. 15, lines 35-53).

Claim Rejections - 35 USC § 103

- 5. The following is a quotation of 35 U.S.C. § 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 6. Claims 5 and 14 are rejected under 35 U.S.C. § 103(a) as being unpatentable over Reshef in view of Ojard et al (U.S. Pat. No. 6826242; "Ojard").

Regarding claim 5, Reshef discloses the limitations of claim 1 as applied above.

Reshef discloses the possible use of a decision feedback equalizer or "DFE" (col. 9, lines 55-60) but does not explicitly disclose using a DFE with whitening matched filtering. However, Ojard teaches the benefits of using a DFE with a whitening filter.

Ojard teaches that using a whitening filter reduces noise power and partially or fully cancels interfering signals (col. 18, lines 34-55). Therefore, it would have been obvious to one having ordinary skill in the art at the time which the invention was made that the DFE of Reshef could be modified to utilize a whitening filter as suggested by Ojard

because it aides in reducing noise power and partially or fully cancelling interfering signals.

Regarding claim 14, Reshef discloses the limitations of claim 10 as applied above. Further, Reshef in view of Ojard disclose the remaining limitations of the claim as applied 5 above.

7. Claims 8 and 17 are rejected under 35 U.S.C. § 103(a) as being unpatentable over Reshef.

Regarding claim 8, Reshef discloses the limitations of claim 1 as applied above. Further, Reshef discloses de-interleaving (fig. 2, ref. 62; col. 10, lines 20-25), and incremental redundancy steps (col. 3, lines 2-5) before convolutional decoding (fig. 2, ref. 64). Reshef discloses that the encoder (fig. 2, ref. 34) adds "redundancy" bits to the transmitted data (col. 8, lines 40-46). Hence, the decoder, must act upon the redundancy in "incremental redundancy steps" to remove the redundancy (col. 3, lines 2-5). Moreover, in conjunction with Reshef's simulated embodiment of figure 9 (which inherits the features of the embodiment of figures 2 and 3), it is disclosed that 8-PSK bursts are modulated utilizing "punctured rate 1/3 convolutional coding" (col. 19, lines 56-63). Reshef does not explicitly disclose de-puncturing the encoded data among decoding of a transmitted signal (i.e. fig. 9, ref. 162). However, for the utility of the receipt of punctured encoded data, one skilled in the art would find it obvious to depuncture the received data before decoding it. Therefore, because puncturing is utilized in the coding of Reshef's signals transmitted, it is obvious to one having ordinary skill in the art at the time which the invention was made that Reshef's decoder should utilize

Art Unit: 2611

de-puncturing as a compliment to the puncturing encoding to maintain the integrity of the data transmitted.

Regarding claim 17, Reshef discloses the limitations of claim 10 as applied above. Further, Reshef discloses the remaining limitations of the claim as applied to claim 8 above.

8. Claims 23-25 are rejected under 35 U.S.C. § 103(a) as being unpatentable over Reshef in view of Gu (U.S. Pub. No. 2002/0085651).

Regarding claim 23, Reshef discloses the limitations of claim 22 as applied above. Reshef does not disclose that the confidence values further comprise confidence values based on interpolation between values in the look-up table. However, the interpolation of values in a look-up table is illustrated in the art as suggested by Gu (¶ 0044). One skilled in the art is aware that interpolating among values in a look-up table would provide greater granularity among look-up table entries. Therefore, it would have been obvious to one having ordinary skill in the art at the time which the invention was made that the values in the look-up table of Reshef could be interpolated as suggested by Gu to determine intermediate look-up table values because it would permit additional granularity in the embodiment.

Regarding claim 24, Reshef discloses the limitations of claim 1 as applied above. Further, Reshef in view of Gu disclose the remaining limitations of the claim as applied to claim 23 above.

Art Unit: 2611

Regarding claim 25, Reshef discloses the limitations of claim 10 as applied above. Further, Reshef in view of Gu disclose the remaining limitations of the claim as applied to claim 25 above.

Conclusion

9. Any inquiry concerning this communication or earlier communications from the examiner should be directed to JASON M. PERILLA whose telephone number is (571)272-3055. The examiner can normally be reached on M-F 8-5 EST.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Chieh M. Fan can be reached on (571) 272-3042. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
